CLI setup stores your AWS identity on your machine

This is required for:

- DynamoDB
- S3
- Literally **any AWS service**

After login to the account → AWS accounts/ Access keys:

In your terminal, run (yellow parts are what you are going to enter):

brew install awscli

aws configure sso

SSO session name (Recommended): Part A
SSO start URL [None]: Part B
SSO region [None]: Part C
SSO registration scopes [sso:account:access]: just hit return button

The only AWS account available to you is: Part D
Using the account ID Part D
The only role available to you is: AWSAdministratorAccess
Using the role name "AWSAdministratorAccess"

Default client Region [None]: Part C
CLI default output format (json if not specified) [None]: json
Profile name [AWSAdministratorAccess-Part D]: Part A

1️⃣ When using CLI

e.g.

aws s3 ls --profile PartA

2️⃣ If the token expires

Run this to refresh your session:

aws sso login --Part A
