**** Please use your personal Gmail account ****

1️⃣ Create a Google Cloud Project

Go to Google Cloud Console → APIs & Services.

- Click **"Select a project" → "New Project"**
- Give it any name (e.g., *Docs Text Extractor*)

2️⃣ Enable the Google Docs API

Still in the Cloud Console:

- Go to **APIs & Services → Library**
- Search for **"Google Docs API"**
- Click **Enable**

3️⃣ Create OAuth 2.0 Credentials

Go to **APIs & Services → Credentials**:

- Click **"Create Credentials" → "OAuth client ID"**
- If prompted, configure the **OAuth consent screen**

Field	What to enter
App name	Anything (e.g. *Docs Text Extractor*)
User support email	Your Gmail address
Audience Type	External
Developer contact information	Your Gmail again

- Click **Create**

4️⃣ Back to "Credentials" Page

Now go back to **APIs & Services → Credentials**.

Click **"+ CREATE CREDENTIALS" → "OAuth client ID"** again.

5️⃣ Create OAuth Client

- Choose **Application type: Desktop app**
- Give it any name (e.g. Docs Extractor)
- Click **Create**

You'll then see a popup with:

"Your OAuth client has been created"

Click **Download JSON**.

That's your **`credentials.json`** file (need to rename it)

6️⃣ Create OAuth Client

Under "Audience"/ Test Users → click "Add user" (add your email account)

7️⃣ Run Your Python Script

** credentials.json, extract_doc_json.py, token.json under the same folder directory **

Now that you've got your `credentials.json`, go back to your terminal or notebook and run:

```
python extract_doc_json.py
```

Here is the reference for code in `extract_doc_json.py`

You'll see a browser pop up asking you to log in and approve access.

- Log in with your Gmail account
- Approve
- A **`token.json`** file will be created automatically

Then the script will successfully pull the document content and save it to a `.json` file (e.g. "`raw_text_breast.json`")
